

We are going to install Thonny and then test it. Start a browser and go to:

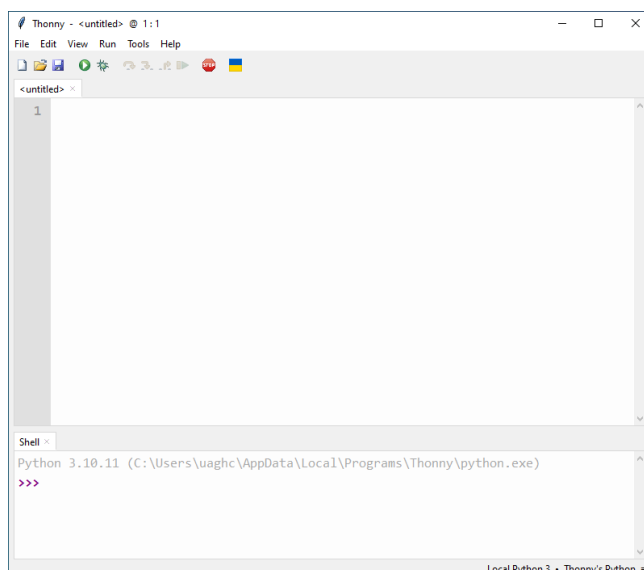

I downloaded and started the Windows version:

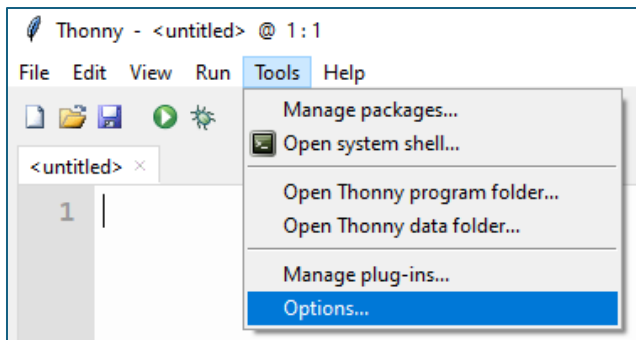

Now you just have to wait. Start Thonny after it is installed, do not change any settings, and click 'Let's go!':

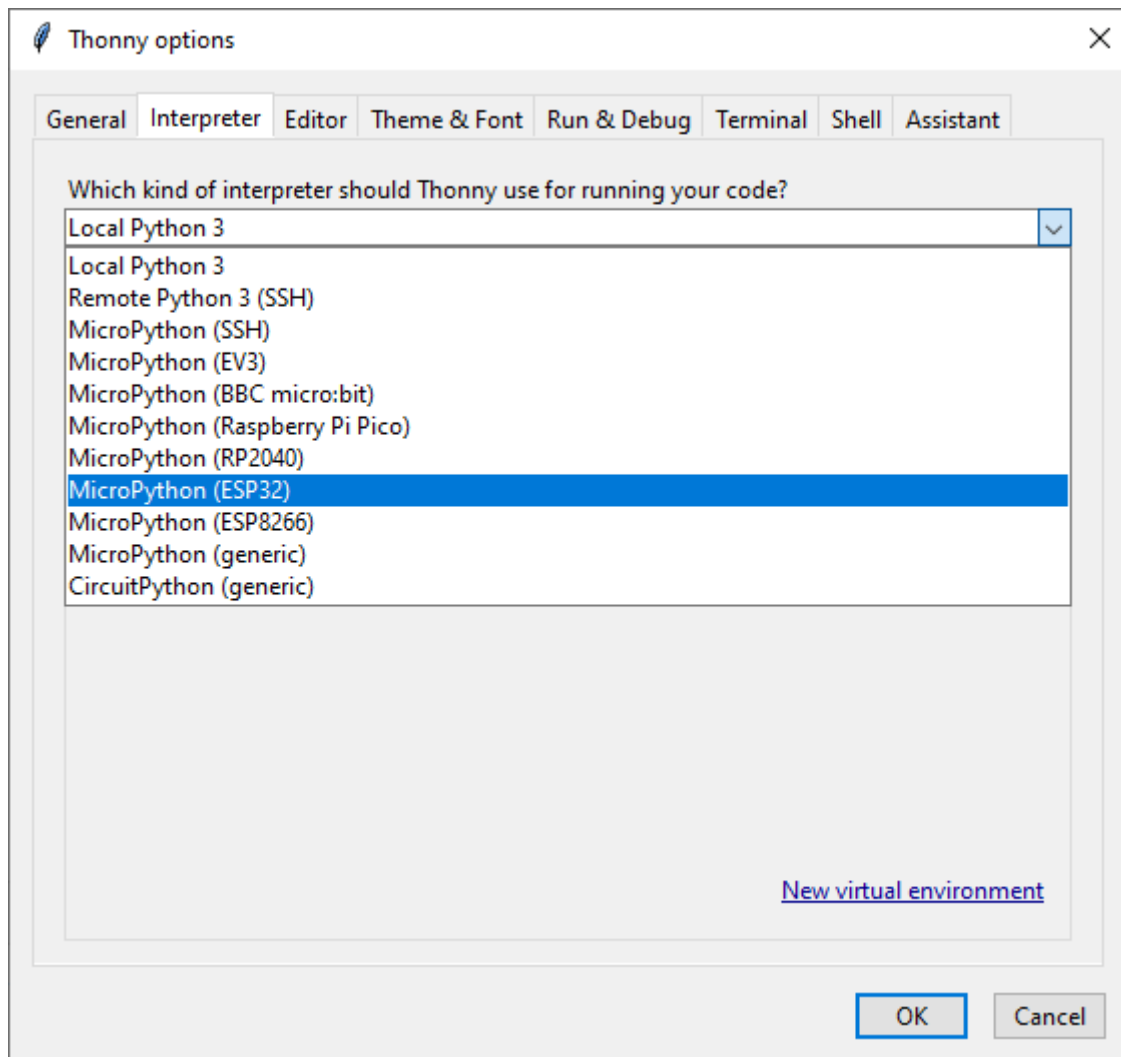

Thonny starts up, there is nothing to see yet:

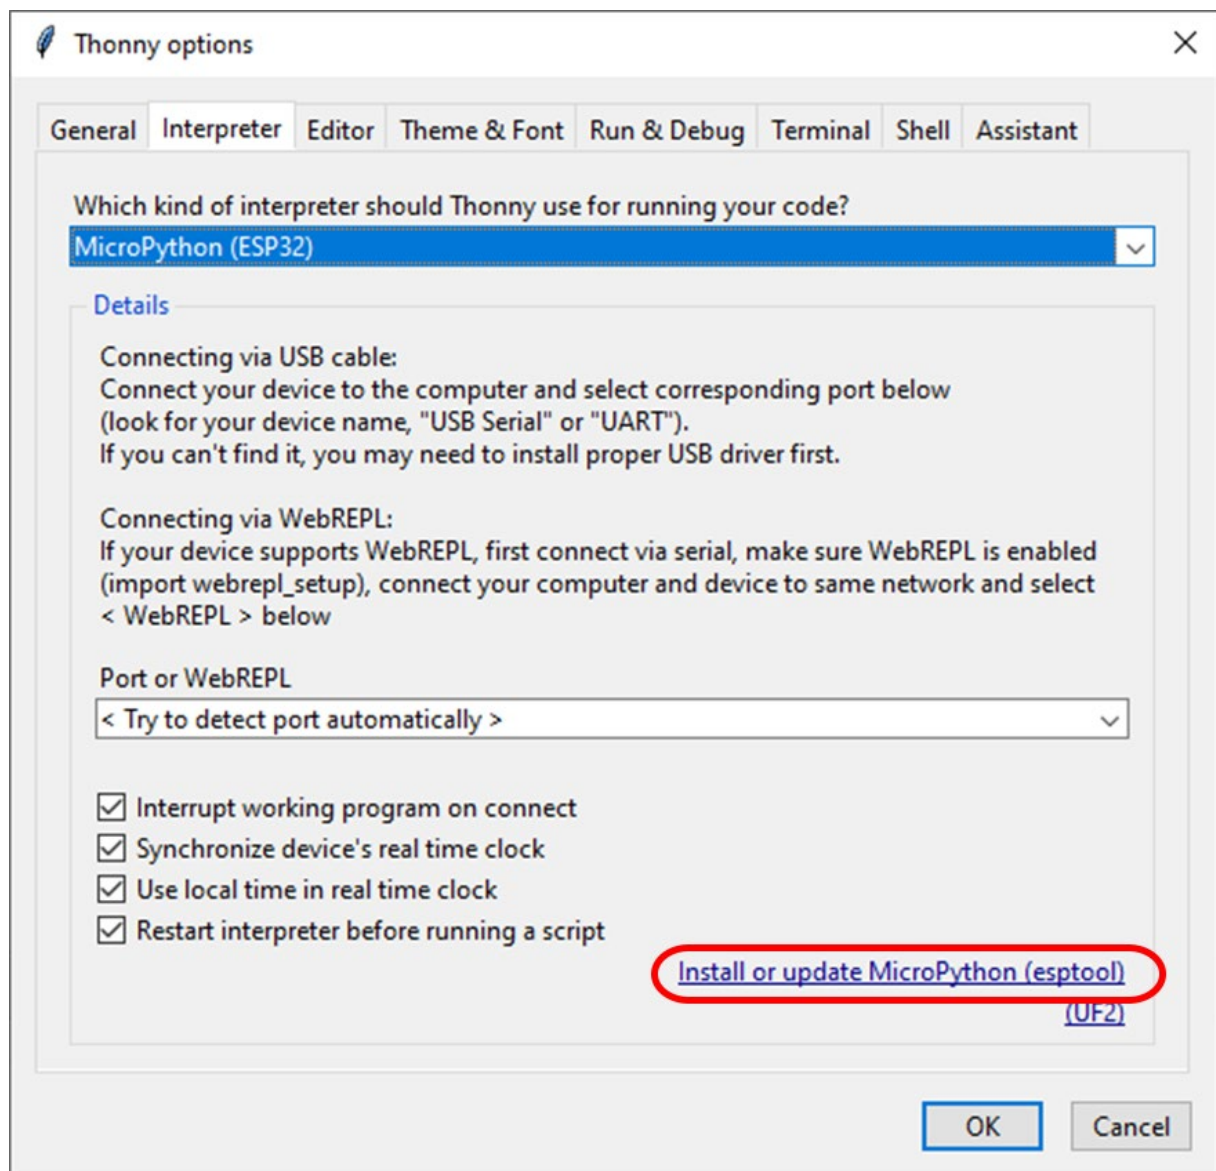

We will now first set up Thonny for MicroPython. Go to "Tools", "Options":

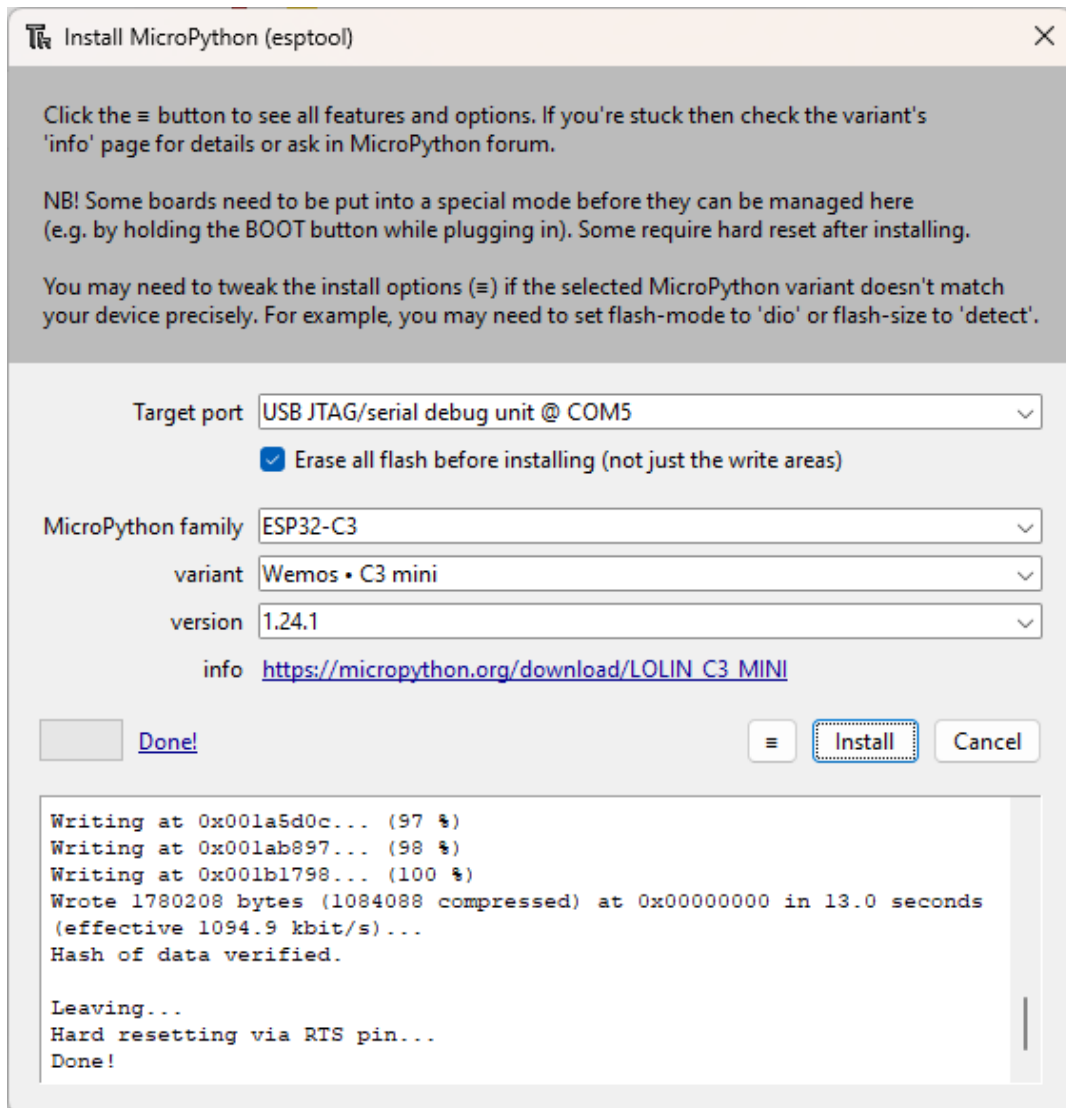

Go to the "Interpreter" tab and choose "MicroPython (ESP32)":

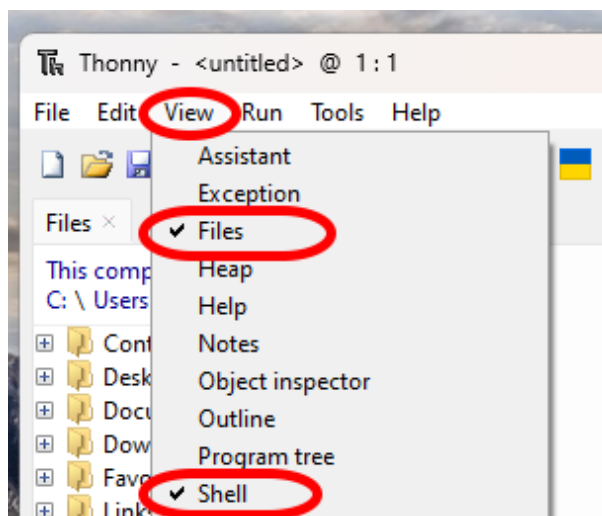

On the "Interpreter" tab, click "Install or update Micropython (esptool)":

Choose the following settings (the version may be newer) and click "Install" (this picture is the result):

Close the window and change the following in the "View" menu:

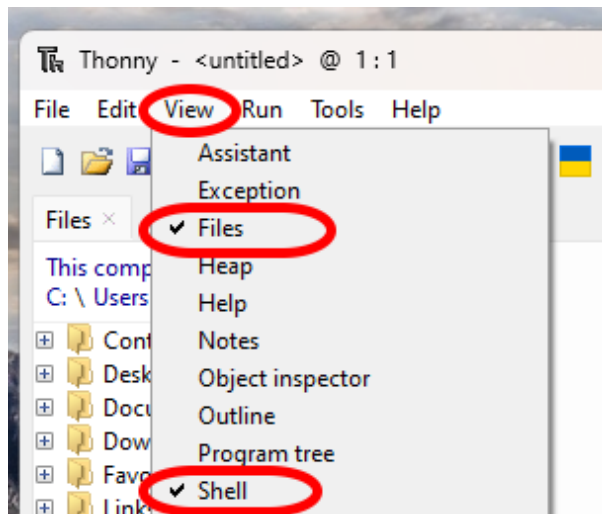

You have now successfully set up Thonny.

To Do: Describe the use of Thonny

Attachment – Thonny settings

My favorite settings (do with them what you want). First the "View" menu:

The rest of the settings can be found via "Tools", "Options":
